Information contained in this report includes the most commonly used Resources Evaluation statistics. However, additional forest resource data can be provided to interested users. Persons requesting additional information that can be provided from the raw inventory data are expected to pay for the retrieval costs. These costs will vary depending on the complexity of the request, from less than \$100 for a relatively simple request to \$2,000 for a complex retrieval involving the services of a Resources Evaluation computer programmer. If requests for data conflict with ongoing Resources Evaluation work, requests will be scheduled so as to minimize the impact on the work unit.

Requests for unpublished information may be directed to:

## FOREWORD

Forest Inventory and Analysis (formerly called Forest Survey) is a continuing endeavor as mandated by the Forest and Rangeland Renewable Resources Planning Act of 1974, which was preceded by the McSweeney-McNary Forest Research Act of 1928. Its objective is to periodically inventory the Nation's forest land to determine its extent, condition, and volume of timber, growth, and depletions. This kind of up-to-date information is essential to frame intelligent forest policies and programs. USDA Forest Service regional experiment stations are responsible for conducting these inventories and publishing summary reports for individual States. The North Central Forest Experiment Station is responsible for Resources Evaluation work done in Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, eastern South Dakota, and Wisconsin.

Fieldwork for the 1980 Southern Lower Peninsula forest inventory was begun in November 1980 and completed in May 1981. Reports on the three previous surveys of Michigan's timber resource are dated 1935, 1955, and 1966. Similar Resource Bulletins reporting statistical highlights and detailed tables on the other Survey Units in Michigan (see cover) are available. In addition to these statistical reports, a series of reports will be published that will analyze the State's timber resource.

The Michigan Department of Natural Resources contacted all primary wood-using plants in the State and information from this canvass was used to help estimate the quantity of timber products harvested in Michigan.

Aerial photos used in the Southern Lower Peninsula Forest Inventory were furnished by the Michigan Department of Natural Resources and the Huron-Manistee National Forest.

# TIMBER RESOURCE OF MICHIGAN'S SOUTHERN LOWER PENINSULA, 1980

Jerold T. Hahn  
*Principal Mensurationist*

## HIGHLIGHTS Forest Area

- Forest land accounted for 2.5 million acres (18 percent of the Unit's land area) in 1980, compared to 2.9 million acres (20 percent) in 1966.
- Commercial forest land occupied 2.4 million acres (97 percent of the forest land) in 1980, compared to 2.8 million acres (98 percent) in 1966—a 12 percent decline.
- Productive-reserved forest land totaled 81,000 acres in 1980, compared to 31,000 acres in 1966. Since 1966 several State recreation areas have been added that range in size from several to 3,000 acres.
- Nonindustrial private parties owned 2.2 million acres (91 percent of the commercial forest) in 1980.
- The maple-birch forest type (903,000 acres in 1980) increased from 18 percent to 37 percent of commercial forest land to become the dominant forest type, replacing oak-hickory (664,000 acres in 1980), which decreased from 36 percent to 27 percent of commercial forest land.

## Timber Volume

- The volume of growing stock in 1980 was 2.4 billion cubic feet, 26 percent greater than the 1.9 billion<sup>1</sup> in 1966, in spite of the 12 percent loss of commercial forest land between surveys.

---

<sup>1</sup>Published 1966 volumes were adjusted by factors derived from 1980 volume equations to make volumes for the two inventories comparable.

- Sawtimber volume amounted to 7.9 billion board feet<sup>2</sup> in 1980.
- Hardwoods make up 93 percent of the growing-stock volume.
- Soft maple (398 million cubic feet), select red oak (338 million), and select white oak (309 million) contain the highest volumes, and together account for 42 percent of the growing-stock volume.
- Average growing-stock volume per acre in 1980 was 998 cubic feet (12.6 cords), compared to 692 cubic feet (8.7 cords) in 1966.
- Sixty percent of the sawtimber volume is in grade 3 saw logs.
- The volume in cull trees (rough, rotten, and short-log cull) is 149 million cubic feet; salvable dead tree volume is 31 million cubic feet.

## Stand Conditions

- Net annual growth on growing-stock trees was 88 million cubic feet in 1979, compared to 69 million in 1965.
- The net annual growth rate of growing stock was the same in 1979 as it was in 1965—3.6 percent of inventory.
- Net growth averaged 35.6 cubic feet per acre in 1979 and 23.8 cubic feet per acre in 1965.
- Annual mortality of growing stock amounted to 18 million cubic feet (0.7 percent of inventory) in 1979, compared to 15 million (0.7 percent of inventory) in 1965.

---

<sup>2</sup>International 1/4-inch rule.

- Disease accounted for 39 percent of the mortality in 1979—chiefly diseases of aspen and elm.
- Ninety-two percent of the commercial area is capable of growing trees 51 feet and taller at age 50, and 54 percent of the area can grow trees 71 feet and taller at the same age.

## Timber Use

- Timber removals from growing stock in 1979 amounted to 37 million cubic feet (1.5 percent of inventory), compared to 45 million cubic feet (2.3 percent of inventory) in 1965.
- The oaks made up 42 percent of the 1979 removals volume, although they account for only 31 percent of the growing-stock volume.
- Output of timber products totaled 51 million cubic feet in 1978, 97 percent of which was hardwood, and 45 percent of which was saw logs.

- Wood residue from primary plants in 1978 totaled 10.8 million cubic feet only 0.3 million of which were not used.

## Biomass

- Live shrub biomass (including trees less than 1-inch in d.b.h.) was highest in the aspen forest type—3,877 pounds per acre (green weight) in 1980.
- Live tree biomass (trees greater than 1-inch in d.b.h.) totaled 138 million green tons (56 tons per acre) in 1980.
- Highest yields of live tree biomass (green weight) are in the oak-hickory forest type (73 tons per acre), the white pine type (65 tons), the maple-birch type (55 tons), and the red pine type (57 tons).

## APPENDIX

### ACCURACY OF SURVEY

Resources Evaluation information is based on a sampling procedure designed to provide reliable statistics at the State and Survey Unit levels. Consequently, the reported figures are only estimates. A measure of reliability of these figures is given by sampling errors. These sampling errors mean that the chances are two out of three that if a 100-percent inventory had been taken, using the same methods, the results would have been within the limits indicated.

For example, the estimated growing-stock volume in the Southern Lower Peninsula Unit in 1980, 2,459.4 million cubic feet, has a sampling error of  $\pm 2.80$  percent ( $\pm 87,836$  thousand cubic feet). So, the chances are 2 out of 3 that the growing-stock volume from a 100-percent inventory would fall between 2,547.2 and 2,371.6 million cubic feet ( $2,459.4 \pm 87.8$ ).

The following tabulation shows the combined sampling errors for the 1980 Southern Lower Peninsula Forest Inventory:

Item	Unit totals	Sampling error
Growing stock	(Million cubic feet)	(Percent)
Volume	2,459.4	2.80
Growth	87.8	3.50
Removals	37.3	15.50
Sawtimber	(Million board feet)	
Volume	7,945.5	3.65
Growth	332.3	5.18
Removals	174.1	16.50
Commercial forest land	(Thousand acres)	
Area	2,463.4	1.56

As survey data are broken down into sections smaller than State or Survey Unit totals, the sampling error increases. The smaller the breakdown, the larger the sampling error. For example, the sampling error for growing-stock volume in a particular county is higher than that for total growing-stock volume in the Survey Unit (table 74 shows the sampling errors for estimates smaller than Unit totals).

### SURVEY PROCEDURES

The major steps in the survey of the Southern Lower Peninsula Unit were as follows:

1. A total of 76,960 1-acre points were systematically distributed across aerial photos of the entire Unit, except the Huron-Manistee National Forest. These points were classified into land classes, in order to make a preliminary estimate of forest area. Next, a total of 14,450 of these points were stereoclassified as to forest type, stand-size class, and density. Finally, a total of 4,022 points were examined on the ground to correct the preliminary area estimate for classification errors and for actual land use changes since the photos were taken.

	Photo points		Ground plots visited
	Classified	Stereoclassified	
Forest land	14,184	14,184	709
Unproductive forest land	1	1	1
Nonforest land			
With trees	1,973	82	87
Without trees	59,235	0	3,135
Water	1,384	0	68
Questionable	183	183	22
Total	76,960	14,455	4,022

At each of the forest ground plot locations, variable-radius plots (basal area factor 37.5) were established at 10 points uniformly placed over the sample acre. Tree measurements made at these locations and at 162 plots established in 1966 and remeasured in 1980 were the basis for estimates of timber volume, growth, mortality, number of trees, and other forest classifications on land other than National Forest land. Estimates for National Forest land were based on a portion of the 155 plots established in 1976 on commercial forest land on the Manistee National Forest.

2. Growth and mortality on all commercial forest land were estimated using the Stand and Tree Evaluation and Modeling System (STEMS)<sup>3</sup> after the System was adjusted with factors derived from the re-measurement in 1979 and 1980 of permanent sample plots in the Lower Peninsula that were initially established in 1965. STEMS is an individual tree-growth projection system that uses the following stand and tree characteristics to "grow" trees by updating tree diameter and tree status (live, dead, or cut): species, tree diameter, crown ratio, site index, basal area,

and average stand diameter. These characteristics were used to produce growth and mortality rates that were adjusted based on ground conditions gained from re-measurement of plots and applied to trees on the tree list to yield an updated tree list. Local volume equations were applied to the original and updated tree lists to estimate volumes of growth and mortality.

3. Under an agreement with the Huron-Manistee National Forest, North Central Station crews established 10-point variable radius plots on the Huron-Manistee Forest in 1976. The Huron-Manistee National Forest provided the Station with the area of commercial forest land by forest type, stand-size class, and density for the Forest, and the Station computed all area and volume data in the same manner non-National Forest data were computed. Area and volume tables were then approved by the Huron-Manistee National Forest staff.

4. Statistics on timber utilization during 1978 were obtained from mill surveys. The Michigan Department of Natural Resources canvassed residential sawmills, veneer mills, and other primary wood-using plants. The North Central Forest Experiment Station canvassed out-of-state sawmills, pulpmills, and veneer mills to determine their use of timber from Michigan. Fuelwood and fencepost output was based on a sample of public and private landowners to determine their production of fuelwood and fenceposts, and on a canvass of industrial and public timber owners. Estimates of primary mill residue used for fuelwood were obtained from the canvass of Michigan primary wood-using plants. Timber cut for products by ownership class was determined by a canvass of public and industrial timber owners. The portion of timber cut accounted for by the latter owners was grouped under "farmer and other owners".

5. A total of 2,239 felled trees on 123 active logging operations were measured throughout the State during 1977-1978 to develop wood utilization factors for converting timber products output to timber removals for saw logs and pulpwood. Factors for all other products were obtained during the 1964-1965 Michigan utilization study.

6. Field data were sent to St. Paul for compilation.

<sup>3</sup>For more information on STEMS, see: Belcher, D. L.; Holdaway, M. R.; Brand, G. J. A description of STEMS: The stand and tree evaluation and modeling system. Gen. Tech. Rep. NC-79. St. Paul, MN: U.S. Department of Agriculture, Forest Service, North Central Forest Experiment Station; (In prep.) p.

# COMPARING MICHIGAN'S FOURTH INVENTORY WITH THE THIRD INVENTORY

Data from new forest inventories are often compared with data from earlier inventories to determine trends in forest resources. Changes in procedures and definitions between surveys make it necessary to adjust earlier survey data so that they are comparable to data from the new survey. A consistency check was made for each Forest Survey Unit in Michigan to ensure that the changes observed between inventories reflect actual changes in the resource and not changes in definitions or procedures.

## Identifying and Correcting Definitional or Procedural Changes

In Michigan's Southern Lower Peninsula Unit definitional or procedural changes between the 1966 and 1980 inventories included changes in definitions of ownership classes and productive-reserved forest land and in procedures for determining the area of nonforest land by land class, the number of trees by 2-inch diameter class, and the volume equations.

In 1966, State Forest was a separate owner class and included only land on State Forests. Other forested State-owned land was included under the Other Public ownership class. In 1980, the State owner class included all State land. However, State-owned commercial forest land outside the State Forest areas is small in the Northern Lower Peninsula and general comparisons may be made between the 1966 and 1980 State estimates.

Some mining companies were called diversified forest industry in 1966 and classed under the Forest Industry ownership class. In 1980 these companies were classed under Miscellaneous Private Corporation ownership class. Therefore, a comparison of statistics for Forest Industry owner between 1966 and 1980 is only possible if you combine the Forest Industry and Miscellaneous Private Corporation ownerships in 1980.

During the 1966 Forest Inventory, Christmas tree plantations were classified as commercial forest land whereas they are now classified as productive-reserved forest land. The 1966 commercial forest and productive-reserved areas were adjusted so that they are comparable to 1980 estimates.

In the 1966 Forest Inventory, the 1964 Census of Agriculture estimates of cropland and pasture and rangeland areas were used in our inventory report tables. The 1980 inventory estimates of cropland and pasture and rangeland come from aerial photointerpretation done by Resources Evaluation personnel in St. Paul. The published 1966 estimates of cropland and pasture and rangeland areas were adjusted to be compatible with 1980 estimates.

The procedures used to determine the number of growing-stock trees by species group and 2-inch diameter class have improved between the 1966 and 1980 forest inventories. The procedure used in 1966 over-estimated the number of growing-stock trees, especially in the lower diameter classes. Adjustments were made in the 1966 estimates of number of trees so that differences between 1966 and 1980 represent actual changes in the resource, not changes in procedures. Additional adjustments were made in the 1966 number of growing-stock trees to reflect the transfer of Christmas tree plantations to productive-reserved forest land.

The volume equations used in 1980 gave more accurate estimates of tree volume than those used in 1966. Therefore, the 1966 volumes were adjusted by factors derived from the 1980 volume equations to make them comparable to 1980 volumes.

## LOG GRADE

In Michigan's Southern Lower Peninsula the butt log of every sawtimber tree on every full permanent sample plot was graded for quality. Additionally, all of the logs in a smaller sample of trees throughout the State (2,239 trees) were graded. The volume yield by log grade for each tree in the latter sample was used to distribute the volume of trees in the former sample into log-grade classes. The resulting volumes by log-grade classes were expanded to provide an estimate for the entire Unit.

Logs were graded on the basis of external characteristics as indicators of quality. Hardwood species were graded according to "Hardwood Log Grades for Standard Lumber."<sup>4</sup> The best 12-foot section of the lowest 16-foot hardwood log, or the best 12-foot upper section if the butt log did not meet minimum log-grade standards, was graded as follows:

<sup>4</sup>Vaughn, C. L.; Wollin, C. A.; McDonald, K. A.; Bulgrin, E. H. *Hardwood log grades for standard lumber. Res. Pap. FPL 63. Madison, WI: U.S. Department of Agriculture, Forest Service, Forest Products Laboratory; 1966. 52 p.*

# Forest Service standard grades for hardwood factory saw logs

Grading factors	Specifications							
	Log grade 1			Log grade 2			Log grade 3	
Position in tree	Butts only	Butts and uppers		Butts and uppers			Butts and uppers	
Scaling diameter, inches	<sup>1</sup> 13-15	16-19	20 +	<sup>2</sup> 11 +	12 +			8 +
Length without trim, feet	10 +			10 +	8-9	10-11	12 +	8 +
Required clear cuttings <sup>3</sup> of each of three best faces <sup>4</sup>	Min. length, feet	7	5	3	3	3	3	2
	Max. + number	2	2	2	2	2	2	No Limit
	Min. proportion of log length required in clear cutting	5/6	5/6	5/6	2/3	3/4	2/3	2/3
Maximum sweep and crook allowance	For logs with less than one-fourth of end in sound defects	15 percent			30 percent			50 percent
	For logs with more than one-fourth of end in sound defects	10 percent			20 percent			35 percent
Maximum scaling deduction	40 percent <sup>5</sup>			50 percent <sup>6</sup>			50 percent	

<sup>1</sup>Ash and basswood butts can be 12 inches if they otherwise meet requirements for small #1's.

<sup>2</sup>Ten-inch logs of all species can be #2 if they otherwise meet requirements for small #1's.

<sup>3</sup>A clear cutting is a portion of a face, extending the width of the face, that is free of defects.

<sup>4</sup>A face is one-fourth of the surface of the log as divided lengthwise.

<sup>5</sup>Otherwise #1 logs with 41-60 percent deductions can be #2.

<sup>6</sup>Otherwise #2 logs with 51-60 percent deductions can be #3.

## Forest Service standard specifications for hardwood construction logs (tie and timber logs)<sup>1</sup>

Position in tree		Butt and upper
Min. diameter, small end		8 inches +
Min. length, without trim		8 feet
Clear cuttings		No requirements.
Sweep allowance, absolute		One-fourth of the diameter at the small end for each 8 feet of length.
Sound surface defects	Single knots	Any number, if no one knot has an average diameter above the callus in excess of one-third of the log diameter at point of occurrence.
	Whorled knots	Any number if sum of knot diameters above the callus does not exceed one-third of the log diameter at point of occurrence.
	Holes	Any number provided none has a diameter over one-third of the log diameter at point of occurrence, and none extends more than 3 inches into included timber. <sup>2</sup>
Unsound surface defects		Same requirements as for sound defects if they extend into included timber. <sup>2</sup> No limit if they do not.
End defects	Sound	No requirements.
	Unsound	None allowed; log must be sound internally, but will admit one shake not to exceed one-fourth the scaling diameter and will admit a longitudinal split not extending more than 5 inches into the contained timber.

<sup>1</sup>These specifications are minimum for the class. If, from a group of logs, factory logs are selected first, thus leaving only nonfactory logs from which to select construction logs, then the quality range of the construction logs so selected is limited, and the class may be considered a grade. If selection for construction logs is given first priority, it may be necessary to subdivide the class into grades.

<sup>2</sup>Included timber is always square, and dimension is judged from small end.

Softwood species were graded according to the following specifications on the following page.

# Log Grades for Eastern White Pine

Log grade	Minimum size Diameter	Length <sup>1</sup>	Sweep or crook allowance	Total cull allowance including sweep	Maximum weevil injury	Allowable knot size (inches) <sup>2</sup> on three best faces or minimum clearness on four faces
	(Inches)	(Feet)	(Percent)	(Number)	(Number)	(Inches)
1	12 & 13 14 +	8-16 10-16	20 20	50 50	0 0	Four faces clear full length Two faces clear full length, or four faces clear 50 percent length (6 foot min. length) <sup>3</sup>
2	6 +	8-16	30	50	0	Sound knots 1. e <sup>4</sup> D/6 and less than 3 inches. <sup>5</sup> Unsound knots: 1. e. 1 1/2 inches and for: butt, lots 1. e. D/12, upper logs 1. e. D/10, or four faces clear 50 percent of length
3	6 +	8-16	40	50	8-foot logs 1 weevil 10-foot + logs: 2 weevils	Sound knots 1. e. D/3 and less than 5 inches. Unsound knots 1. e. D/6 and less than 2 1/2 inches.
4	6 +	8-16	50	50	No limit	No limit

<sup>1</sup>Plus trim.

<sup>2</sup>Disregard all knots less than inch diameter in all grades.

<sup>3</sup>The sum of the diameter of sound knots plus twice the sum of the diameter of unsound knots (in inches) is less than or equal to half of the diameter of the log (inches).

<sup>4</sup>1. e. means less than or equal to.

<sup>5</sup>D means d. i. b. of log at location of knot.

## Log Grades for Jack Pine and Red Pine

*Grade 1:* logs with three or four clear faces.<sup>5</sup>

*Grade 2:* logs with one or two clear faces.

*Grade 3:* logs with no clear faces.

After the tentative log grade is established, the log will be degraded one grade for each of the following, except that no log can be degraded below grade 3. Net scale after deduction for defect must be at least 50 percent of the gross contents of the log.

1. *Sweep.* Degrade any tentative 1 or 2 log one grade if sweep amounts to 3 or more inches and equals or exceeds one third the diameter inside bark at small end.

2. *Heart rot.* Degrade any tentative 1 or 2 log one grade if conk, massed hyphae, or other evidence of advanced heart rot is found anywhere in it.

<sup>5</sup>A face is one fourth of the circumference in width extending full length of the log. Clear faces are those free of: knots measuring more than 1/2-inch in diameter, overgrown knots of any size, holes more than 1/4-inch in diameter. Faces may be rotated to obtain the maximum number of clear ones.

## Log Grades For All Other Softwood Logs

### Grade 1

1. Logs must be 16 inches in diameter or larger, 10 feet in length or longer, and have not more than 30 percent of gross scale deducted for defect.
2. Logs must be at least 75 percent clear on each of three faces.
3. All knots outside clear cutting must be sound and not more than 2-inches in size.

### Grade 2

1. Logs must be 12 inches in diameter or larger, 10 feet in length or longer, and have a net scale of at least 50 percent of the gross contents of the log after deduction for defect.
2. Logs must be at least 50 percent clear on each of three faces or 5 percent clear on two faces.

### Grade 3

1. Logs must be 6 inches in diameter or larger, 8 feet in length or longer, and have a net scale of at least 50 percent of the gross contents of the log after deduction for defect.

Note: (A) Diameters are diameter inside bark (d.i.b.) at small end of log.

(B) Percent clear refers to percent clear in one continuous section.

## TREE SPECIES GROUPS IN MICHIGAN'S SOUTHERN LOWER PENINSULA UNIT<sup>6</sup>

### SOFTWOODS

Eastern white pine. . . . . *Pinus strobus*  
Red pine. . . . . *Pinus resinosa*  
Jack pine. . . . . *Pinus banksiana*  
White spruce. . . . . *Picea glauca*  
Black spruce. . . . . *Picea mariana*  
Balsam fir. . . . . *Abies balsamea*  
Eastern hemlock. . . . . *Tsuga canadensis*  
Tamarack. . . . . *Larix laricina*  
Northern white-cedar. . . . . *Thuja occidentalis*

### OTHER SOFTWOODS

Eastern redcedar. . . . . *Juniperus virginiana*  
Austrian pine. . . . . *Pinus nigra*  
Scotch pine. . . . . *Pinus sylvestris*

### HARDWOODS

#### White oaks

White oak. . . . . *Quercus alba*  
Swamp white oak. . . . . *Quercus bicolor*  
Bur oak. . . . . *Quercus macrocarpa*  
Chinkapin oak. . . . . *Quercus muehlenbergii*

#### Select red oak

Northern red oak. . . . . *Quercus rubra*

#### Other red oaks

Scarlet oak. . . . . *Quercus coccinea*  
Northern pin oak. . . . . *Quercus ellipsoidalis*  
Pin oak. . . . . *Quercus palustris*  
Black oak. . . . . *Quercus velutina*

#### Hickories

Bitternut hickory. . . . . *Carya cordiformis*  
Pignut hickory. . . . . *Carya glabra*  
Shellbark hickory. . . . . *Carya laciniata*  
Shagbark hickory. . . . . *Carya ovata*  
Mockernut hickory. . . . . *Carya tomentosa*

Yellow birch. . . . . *Betula alleghaniensis*

#### Hard maples

Sugar maple. . . . . *Acer saccharum*  
Black maple. . . . . *Acer nigrum*

#### Soft maples

Red maple. . . . . *Acer rubrum*  
Silver maple. . . . . *Acer saccharinum*  
American beech. . . . . *Fagus grandifolia*

#### Ashes

White ash. . . . . *Fraxinus americana*  
Black ash. . . . . *Fraxinus nigra*  
Green ash. . . . . *Fraxinus pennsylvanica*

Balsam poplar. . . . . *Populus balsamifera*

Eastern Cottonwood. . . . . *Populus deltoides*

#### Aspens

Bigtooth aspen. . . . . *Populus grandidentata*  
Quaking aspen. . . . . *Populus tremuloides*

Basswood. . . . . *Tilia americana*

Yellow poplar. . . . . *Liriodendron tulipifera*

Black walnut. . . . . *Juglans nigra*

Black cherry. . . . . *Prunus serotina*

Butternut. . . . . *Juglans cinerea*

#### Elms

American elm . . . . . *Ulmus americana*

Slippery elm. . . . . *Ulmus rubra*

Rock elm. . . . . *Ulmus thomassii*

Paper birch. . . . . *Betula papyrifera*

### OTHER HARDWOODS

Boxelder. . . . . *Acer negundo*

River birch. . . . . *Betula nigra*

Black willow. . . . . *Salix nigra*

Ohio buckeye. . . . . *Aesculus glabra*

Flowering dogwood. . . . . *Cornus florida*

Honey locust. . . . . *Gleditsia triacanthos*

Osage-orange. . . . . *Maclura pomifera*

Black tupelo. . . . . *Nyssa sylvatica* var. *sylvatica*

Sycamore. . . . . *Platanus occidentalis*

Black locust. . . . . *Robinia psuedoacacia*

Sassafras. . . . . *Sassafras albidum*

## METRIC EQUIVALENTS OF UNITS USED IN THIS REPORT

1 acre = 4,046.86 square meters or 0.405 hectare.

1,000 acres = 405 hectares.

1,000 board feet (International ¼-inch log rule) = 3.48 cubic meters.

Breast height = 1.4 meters above the ground.

1 cubic foot = 0.0283 cubic meter.

1 foot = 30.48 centimeters or 0.3048 meter.

1 inch = 25.4 millimeters, 2.54 centimeters, or 0.0254 meter.

1 pound = 0.454 kilogram.

1 ton = 0.907 metric ton.

<sup>6</sup>The common and scientific names are based on, Little, Elbert L. Check list of native and naturalized trees of the United States. Agric. Handbk. 541. Washington, D.C.: U.S. Department of Agriculture, Forest Service, 1979. 375 p.

## DEFINITION OF TERMS

**Acceptable trees.**—Growing-stock trees of commercial species that meet specified standards of size and quality but do not qualify as desirable trees.

**Area-condition classes.**—*Class 10.*—Areas fully stocked with desirable trees but not overstocked.

*Class 20.*—Areas fully stocked with desirable trees but overstocked with all live trees.

*Class 30.*—Areas medium to fully stocked with desirable trees and with less than 30 percent of the area controlled by other trees and/or inhibiting vegetation or surface conditions that will prevent occupancy by desirable trees.

*Class 40.*—Areas medium to fully stocked with desirable trees and with 30 percent or more of the area controlled by other trees and/or conditions that ordinarily prevent occupancy by desirable trees.

*Class 50.*—Areas poorly stocked with desirable trees but fully stocked with growing-stock trees.

*Class 60.*—Areas poorly stocked with desirable trees but with medium

to full stocking of growing-stock trees.

*Class 70.*—Areas poorly stocked with desirable trees and poorly stocked with growing-stock trees.

**Basal area.**—The area in square feet of the cross section at breast height of a single tree. When the basal area of all trees in a stand are summed, the result is usually expressed as square feet of basal area per acre.

**Biomass.**—The above-ground volume of all live trees (including bark and foliage) reported in green tons. Biomass is made up of 5 components:

*Growing-stock bole.*—Biomass of a growing-stock tree from a 1-foot stump to a variable 4-inch top.

*Growing-stock tops and limbs.*—Biomass of a growing-stock tree from a 1-foot stump minus the growing-stock bole.

*Cull bole.*—Biomass of a cull tree from a 1-foot stump to a variable 4-inch top.

*Cull tops and limbs.*—Biomass of a cull tree from a 1-inch stump minus the cull bole.

*1- to 5-inch trees.*—Biomass of all live trees 1- to 5-inches in diameter at breast height.

**Commercial forest land.**—Forest land producing or capable of producing crops of industrial wood and not withdrawn from timber utilization. (Note: Areas qualifying as commercial forest land have the capability of producing in excess of 20 cubic

feet per acre per year of annual growth under management. Currently inaccessible and inoperable areas are included, except when the areas involved are small and unlikely to become suitable for production of industrial wood in the foreseeable future.) Also see definition of pastured commercial forest land.

**Commercial species.**—Tree species presently or prospectively suitable for industrial wood products. (Note: Excludes species of typically small size, poor form, or inferior quality such as hophornbeam and hawthorn.)

**County and municipal land.**—Lands owned by counties and local public agencies or municipalities, or lands leased to these governmental units for 50 years or more.

**Cull.**—Portions of a tree that are unusable for industrial wood products, because of rot, form, or other defect.

**Desirable trees.**—Growing-stock trees having no serious defects in quality limiting present or prospective use, and of relatively high vigor, and containing no pathogens that may result in death or serious deterioration before rotation age. These are trees that would be favored by forest managers in silvicultural operations.

**Diameter classes.**—A classification of trees based on diameter outside bark, measured at breast height (4- feet above the ground). (Note: d.b.h. is the common abbreviation for diameter at breast height. Two-inch diameter classes are commonly used in Forest Survey, with the even inch the approximate midpoint for a class. For example, the 6-inch class includes trees 5.0 through 6.9 inches d.b.h. inclusive).

**Farm.**—Either a place operated as a unit of 10 or more acres from which the sale of agricultural products totals \$50 or more annually, or a place operated as a unit of less than 10 acres from which the sale of agricultural products for a year amounts to at least \$250. Places having less than the \$50 or \$250 minimum estimated sales in a given year are also counted as farms if they can normally be expected to produce goods in sufficient quantity to meet the requirements of the definition.

**Farmer-owned land.**—Land owned by farm operators. (Note: Excludes land leased by farm operators from nonfarm owners, such as railroad companies and States.)

**Forest land.**—Land at least 16.7 percent stocked by forest trees of any size, or formerly having had such tree cover, and not currently developed for nonforest use. (Note: Stocking is measured by comparison of basal area and/or number of trees, by age or size and spacing with specified standards.) The minimum area for classification of forest land is 1 acre. Roadside, streamside, and shelterbelt strips of timber must have a crown width of at least 120 feet to qualify as forest land. Unimproved roads and trails, streams, or other bodies of water or clearings in forest areas shall be classed as forest if less than 120 feet wide. Also see definitions for land area, commercial forest land, noncommercial forest land, productive-reserved forest land, stocking, unproductive forest land, and water.

**Forest industry land.**—Land owned by companies or individuals operating primary wood-using plants.

**Forest trees.**—Woody plants having a well-developed stem and usually more than 12 feet in height at maturity.

**Forest type.**—A classification of forest land based upon the species forming a plurality of live tree stocking. Major forest types in Michigan are:

*Jack pine.*—Forests in which jack pine comprises a plurality of the stocking. (Common associates include eastern white pine, red pine, aspen, birch, and maple.)

*Red pine.*—Forests in which red pine comprises a plurality of the stocking. (Common associates include eastern white pine, jack pine, aspen, birch, and maple.)

*White pine.*—Forests in which eastern white pine comprises a plurality of the stocking. (Common associates include red pine, jack pine, aspen, birch, and maple.)

*Balsam fir.*—Forests in which balsam fir and white spruce comprise a plurality of stocking with balsam fir the most common. (Common associates include white spruce, aspen, maple, birch, northern white-cedar, and tamarack.)

*White spruce.*—Forests in which white spruce and balsam fir comprise a plurality of the stocking with white spruce the most common. (Common associates include balsam fir, aspen, maple, birch, northern white-cedar, and tamarack.)

*Black spruce.*—Forests in which swamp conifers comprise a plurality of the stocking with black spruce the most common. (Common associates include tamarack and northern white-cedar.)

*Northern white-cedar.*—Forests in which swamp conifers comprise a plurality of the stocking with northern white-cedar the most common. (Common associates include tamarack and black spruce.)

*Tamarack.*—Forests in which swamp conifers comprise a plurality of the stocking with tamarack the most common. (Common associates include black spruce and northern white-cedar.)

*Oak-hickory.*—Forests in which northern red oak, white oak, bur oak, or hickories, singly or in combination, comprise a plurality of the stocking. (Common associates include jack pine, beech, yellow-poplar, elm, and maple.)

*Elm-ash-soft maple.*—Forests in which lowland elm, ash, cottonwood, and red maple, singly or in combination, comprise a plurality of the stocking. (Common associates include birches, spruce, and balsam fir.)

*Maple-birch.*—Forests in which sugar maple, basswood, yellow birch, upland American elm, and red maple, singly or in combination, comprise a plurality of the stocking. (Common associates include white pine, elm, hemlock, and basswood.)

*Aspen.*—Forests in which quaking aspen or bigtooth aspen, singly or in combination, comprise a plurality of the stocking. (Common associates include balsam poplar, balsam fir, and paper birch.)

*Paper birch.*—Forests in which paper birch comprises a plurality of the stocking. (Common associates include maple, aspen, and balsam fir.)

*Exotic.*—Forests in which species not native to Michigan comprise a plurality of the stocking. (Mostly scotch pine plantations.)

**Gross area.**—The entire area of land and water as determined by the Bureau of the Census, 1970.

**Growing-stock trees.**—Live trees of commercial species qualifying as desirable and acceptable trees. (Note: Excludes rough, rotten, and dead trees.)

**Growing-stock volume.**—Net volume in cubic feet of growing-stock trees 5.0 inches d.b.h. and over, from a 1-foot stump to a minimum 4.0 inch top diameter outside bark of the central stem or to the point where the central stem breaks into limbs. Cubic feet can be converted to cords by multiplying by 79 cubic feet per solid wood cord.

**Hardwoods.**—Dicotyledonous trees, usually broad-leaved and deciduous.

**Idle farmland.**—Includes former croplands, orchards, improved pastures, and farm sites not tended within the past 2 years and presently less than 16.7 percent stocked with trees.

**Improved pasture.**—Land currently improved for grazing, by cultivation, seeding, irrigation, or clearing of trees or brush and less than 16.7 percent stocked with live trees.

**Indian land.**—Tribal lands held in fee but administered by the Federal Government.

**Land area.**—A. *Bureau of the Census.* The area of dry land and land temporarily or partly covered by water, such as marshes, swamps, and river flood plains (omitting tidal flats below mean high tide); streams, sloughs, estuaries, and canals less than one-eighth of a statute mile wide; and lakes, reservoirs, and ponds less than 40 acres in area.

B. *Forest Survey.* The same as the Bureau of the Census, except minimum width of streams, etc. is 120 feet and minimum size of lakes, etc. is 1 acre.

**Live trees.**—Growing-stock, rough and rotten trees 1 inch d.b.h. and larger.

**Log grades.**—A classification of logs based on external characteristics as indicators of quality or value. (See Appendix for specific grading factors used.)

**Logging residues.**—The unused growing stock portions of trees cut or killed by logging.

**Maintained road.**—Any road, hard-topped or other surfaces, that is plowed or graded at least once a year. Includes rights-of-way that are cut or treated to limit herbaceous growth.

**Marsh.**—Nonforest land that characteristically supports low, generally herbaceous or shrubby vegetation and that is intermittently covered with water.

**Merchantable.**—Refers to a pulpwood or saw log section that meets pulpwood or saw log specifications, respectively.

**Miscellaneous Federal land.**—Federal land other than National Forest, and land administered by the Bureau of Land Management.

**Miscellaneous private land.**—Privately owned land other than forest-industry and farmer-owned land.

**Mortality.**—The volume of sound wood in growing-stock and sawtimber trees that die annually.

**National Forest land.**—Federal land that has been legally designated as National Forest or purchase

units, and other land under the administration of the USDA Forest Service.

**Net annual growth of growing-stock.**—The annual change in volume of sound wood in live-sawtimber and poletimber trees and the total volume of trees entering these classes through ingrowth, less volume losses resulting from natural causes.

**Net annual growth of sawtimber.**—The annual change in the volume of live sawtimber trees and the total volume of trees reaching sawtimber size, less volume losses resulting from natural causes.

**Net volume.**—Gross volume less deductions for rot, sweep, or other defect affecting use for timber products.

**Noncommercial forest land.**—(a) Unproductive forest land and (b) productive-reserved forest land.

**Noncommercial species.**—Tree species of typically small size, poor form, or inferior quality which normally do not develop into trees suitable for industrial wood products.

**Nonforest land.**—Land that has never supported forests, and land formerly forested where use for timber management is precluded by development for other uses. (Note: Includes areas used for crops, improved pasture, residential areas, city parks, improved roads of any width and adjoining clearings, powerline clearings of any width, and 1- to 40-acre areas of water classified by the Bureau of the Census as land. If intermingled in forest areas, unimproved roads and nonforest strips must be more than 120 feet wide and more than 1 acre in area, to qualify as nonforest land.)

a. *Nonforest land without trees.*—Nonforest land with no live trees present.

b. *Nonforest land with trees.*—Nonforest land with one or more trees per acre at least 5 inches d.b.h.

**Nonstocked land.**—Commercial forest land less than 16.7 percent stocked with growing-stock trees.

**Other removals.**—Growing-stock trees removed but not utilized for products, or trees left standing but “removed” from the commercial forest land classification by land use change. Examples are removals from cultural operations such as timber stand improvement work, land clearing, and changes in land use.

**Ownership.**—Property owned by one owner, regardless of the number of parcels in a specified area.

**Ownership size class.**—The amount of commercial forest land owned by one owner, regardless of the number or parcels.

**Owner tenure.**—The length of time a property has been held by the owner.

**Physiographic class.**—A measure of soil and water conditions that affect tree growth on a site. Physiographic classes used in Resources Evaluation inventories are:

*Xeric sites.*—Very dry soils where excessive drainage seriously limits both growth and species occurrence. Example: sandy jack pine plains.

*Xeromesic sites.*—Moderately dry soils where excessive drainage limits growth and species occurrence to some extent. Example: dry oak ridge.

*Mesic sites.*—Deep, well-drained soils. Growth and species occurrence are limited only by climate.

*Hydromesic sites.*—Moderately wet soils where insufficient drainage or infrequent flooding limits growth and species occurrence to some extent. Example: better drained bottomland hardwood sites.

*Hydric sites.*—Very wet sites where excess water seriously limits both growth and species occurrence. Example: wet, frequently flooded river bottoms and spruce bogs.

**Plant byproducts.**—Plant residues used for products such as mulch, pulp chips, and fuelwood.

**Plant residues.**—Wood and bark materials generated at manufacturing plants during production of other products.

**Poletimber stands.**—(See stand-size class.)

**Poletimber trees.**—Growing-stock trees of commercial species at least 5.0 inches d.b.h., but smaller than sawtimber size.

**Productive-reserved forest land.**—Forest land sufficiently productive to qualify as commercial forest land but withdrawn from timber utilization through statute, administrative regulation, designation, or exclusive use for Christmas tree production, as indicated by annual shearing.

**Rotten trees.**—Live trees of commercial species that do not contain at least one 12-foot saw log or two

saw logs 8 feet or longer, now or prospectively, and/or do not meet Regional specifications for freedom from defect primarily because of rot; that is, when more than 50 percent of the cull volume in a tree is rotten.

**Rough trees.**—(a) Live trees of commercial species that do not contain at least one merchantable 12-foot saw log or two saw logs 8 feet or longer, now or prospectively, and/or do not meet Regional specifications for freedom from defect primarily because of roughness or poor form, and (b) all live trees of noncommercial species.

**Roundwood products.**—Logs, bolts, or other round sections (including chips from roundwood) cut from trees for industrial or consumer uses. (Note: Includes saw logs, veneer logs and bolts; cooperage logs and bolts; pulpwood; fuelwood; piling; poles; posts; hewn ties; mine timbers; and various other round, split, or hewn products.)

**Salvable dead trees.**—Standing or down dead trees that are considered merchantable by Regional standards.

**Saplings.**—Live trees 1.0 to 5.0 inches d.b.h.

**Sapling-seedling stands.**—(See stand-size class.)

**Saw log.**—A log meeting minimum standards of diameter, length, and defect, including logs at least 8 feet long, sound and straight and with a minimum diameter outside bark (d.o.b.) for softwoods of 7 inches (9 inches for hardwoods) or other combinations of size and defect specified by Regional standards.

**Saw log portion.**—That part of the bole of sawtimber trees between the stump and the saw log top.

**Saw log top.**—The point on the bole of sawtimber trees above which a saw log cannot be produced. The minimum saw log top is 7.0 inches d.o.b. for softwoods and 9.0 inches d.o.b. for hardwoods.

**Sawtimber stands.**—(See stand-size class.)

**Sawtimber trees.**—Growing-stock trees of commercial species containing at least a 12-foot saw log or two noncontiguous saw logs 8 feet or longer, and meeting Regional specifications for freedom from defect. Softwoods must be at least 9.0 inches d.b.h. Hardwoods must be at least 11.0 inches d.b.h.

**Sawtimber volume.**—Net volume of the saw log portion of live sawtimber in board feet, International inch rule, from stump to a minimum 7 inches top diameter outside bark (d.o.b.) for softwoods and a minimum 9 inches top d.o.b. for hardwoods.

**Seedlings.**—Live trees less than 1.0 inch d.b.h. that are expected to survive. Only softwood seedlings more than 6 inches tall and hardwood seedlings more than 1 foot tall are counted.

**Short-log (rough tree).**—Sawtimber-size trees of commercial species that contain at least one merchantable 8-to 11-foot saw log but not a 12-foot saw log.

**Shrub biomass.**—The total above-ground weight (including the bark) of selected shrubs and trees less than 1 inch d.b.h.

**Site class.**—A classification of forest land in terms of inherent capacity to grow crops of industrial wood based on fully stocked natural stands.

**Site index.**—An expression of forest site quality based on the height of a free-growing dominant or codominant tree of a representative species in the forest type at age 50.

**Softwoods.**—Coniferous trees, usually evergreen, having needles or scale-like leaves.

**Stand.**—A growth of trees on a minimum of 1 acre of forest land that is stocked by forest trees of any size.

**Stand-age class.**—Age of the main stand. Main stand refers to trees of the dominant forest type and stand-size class.

**Stand-area class.**—The extent of a continuous forested area of the same forest type, stand-size class, and stand-density class.

**Stand-size class.**—A classification of forest land based on the size class of growing-stock trees on the area; that is, sawtimber, poletimber or seedlings and saplings.

a. *Sawtimber stands.*—Stands at least 16.7 percent stocked with growing-stock trees, with half or more of total stocking in sawtimber or poletimber trees, and with sawtimber stocking at least equal to poletimber stocking.

b. *Poletimber stands.*—Stands at least 16.7 percent stocked with growing-stock trees of which

half or more of this stocking is in poletimber and/or sawtimber trees, and with poletimber stocking exceeding that of sawtimber.

c. *Sapling-seedling stands.*—Stands at least 16.7 percent stocked with growing-stock trees of which more than half of the stocking is saplings and/or seedlings.

d. *Nonstocked stands.*—Stands in which stocking of growing-stock trees is less than 16.7 percent.

**State land.**—Land owned by States, or land leased to these governmental units for 50 years or more.

**Stocking.**—The degree of occupancy of land by trees, measured by basal area and/or the number of trees in a stand by size or age and spacing, compared to the basal area and/or number of trees required to fully utilize the growth potential of the land; that is, the stocking standard.

A stocking percent of 100 indicates full utilization of the site and is equivalent to 80 square feet of basal area per acre in trees 5 inches d.b.h. and larger. In a stand of trees less than 5 inches d.b.h., a stocking percent of 100 would indicate that the present number of trees is sufficient to produce 80 square feet of basal area per acre when the trees reach 5 inches d.b.h.

Stands are grouped into the following stocking classes:

*Overstocked stands.*—Stands in which stocking of trees is 134.0 percent or more.

*Fully stocked stands.*—Stands in which stocking of trees is from 101.0 to 133.9 percent.

*Medium stocked stands.*—Stands in which stocking of trees is from 61.0 to 100.9 percent.

*Poorly stocked stands.*—Stands in which stocking of trees is from 16.7 to 60.9 percent.

*Nonstocked areas.*—Commercial forest land on which stocking of trees is less than 16.7 percent.

**Timber removals from growing stock.**—The volume of sound wood in growing-stock trees removed annually for forest products (including roundwood products and logging residues) and for other removals.

**Timber removals from sawtimber.**—The net board-foot volume of live sawtimber trees removed for forest products annually (including roundwood products and logging residues) and for other removals.

**Timber products output.**—All timber products cut from roundwood and byproducts of wood manufacturing plants. Roundwood products include logs,

bolts, or other round sections cut from growing-stock trees, cull trees, salvable dead trees, trees on nonforest land, noncommercial species, sapling-size trees, and limbwood. Byproducts from primary manufacturing plants include slabs, edging, trimmings, miscuts, sawdust, shavings, veneer cores and clippings, and screenings of pulp-mills that are used as pulpwood chips or other products.

**Tree biomass.**—The total aboveground weight (including the bark) of all trees 1 to 5 inches in d.b.h., and the total aboveground weight (including the bark) from a 1-foot stump for trees more than 5 inches in diameter.

**Tree size class.**—A classification of trees based on diameter at breast height, including sawtimber trees, poletimber trees, saplings, and seedlings.

**Unproductive forest land.**—Forest land incapable of producing 20 cubic feet per acre of annual growth or of yielding crops of industrial wood under natural conditions because of adverse site conditions. (Note: Adverse conditions include shallow soils, dry climate, poor drainage, high elevation, steepness, and rockiness.

**Upper stem portion.**—That part of the bole of saw-timber trees above the saw log top to a minimum top diameter of 4.0 inches outside bark or to the point where the central stem breaks into limbs.

**Urban and other areas.**—Areas within the legal boundaries of cities and towns; suburban areas developed for residential, industrial, or recreational purposes; schoolyards, cemeteries, roads; railroads; airports; beaches; powerlines; and other rights-of-way; or other nonforest land not included in any other specified land use class.

**Water.**—(a) *Bureau of the Census.*—Streams, sloughs, estuaries, and canals more than one-eighth of a statute mile wide; and lakes, reservoirs, and ponds more than 40 acres in area.

(b) *Noncensus.*—The same as the Bureau of the Census, except minimum width of streams, etc. is 120 feet and minimum size of lakes, etc. is 1 acre.

**Wooded pasture.**—Improved pasture with more than 16.7 percent stocking in live trees but less than 25 percent stocking in growing-stock trees. Area is currently improved for grazing or there is other evidence of grazing.

**Wooded strip.**—An acre or more of natural continuous forest land that would otherwise meet survey standards for commercial forest land except that it is less than 120 feet wide.

Hahn, Jerold T.

Timber resource of Michigan's Southern Lower Peninsula Unit. 1980. Resour. Bull. NC-66. St. Paul, MN: U.S. Department of Agriculture, Forest Service, North Central Forest Experiment Station; 1982. 119p.

The fourth inventory of the timber resource of Michigan's Southern Lower Peninsula Survey Unit shows a 12 percent decline in commercial forest area and a 26 percent gain in growing-stock volume between 1966 and 1980. Presented are highlights and statistics on area, volume, growth, mortality, removals, utilization, and biomass.
